Date 16 December 2020

Faculty Board

General syllabus for third-cycle studies in Geobiosphere Science with a specialisation in Physical Geography and Ecosystem Science NAGBVN02

This syllabus was approved by the Board of the Faculty of Science on 16 December 2020 and applies to third-cycle students admitted from 1 January 2021. The syllabus is based on the Higher Education Ordinance (1993:100) Chapter 6 Sections 1–11, 25–36, Chapter 7 Sections 34–41 and Annex 2, the Qualifications Ordinance.

1. Available degrees

The programme described in this syllabus can lead to one of the following degrees:

Doctor of Philosophy in Geobiosphere Science with a specialisation in Physical Geography and Ecosystem Science / *Filosofie doktorsexamen i geobiosfärvetenskap med inriktning naturgeografi och ekosystemvetenskap*

Licentiate of Philosophy in Geobiosphere Science with a specialisation in Physical Geography and Ecosystem Science / *Filosofie licentiatexamen i geobiosfärvetenskap med inriktning naturgeografi och ekosystemvetenskap*

In consultation with the Faculty of Engineering, LTH, the Faculty Board has decided (NA35 643/2005) that students admitted to third-cycle studies at the Faculty of Science on the basis of an MSc in Engineering shall be entitled to be awarded the degrees of Doctor of Philosophy in Science or Licentiate of Science without special application.

2. Subject description

Geobiosphere Science is a subject in common for third-cycle studies at the Department of Geology and the Department of Physical Geography and Ecosystem Science. The subject comprises four specialisations: Bedrock Geology, Quaternary Geology, Physical Geography and Ecosystem Science and Geographical Information Science.

The research in Geobiosphere Science is focused on the composition and dynamics of the Earth, the evolution of organisms, the processes and ecosystems of the Earth's surface, as well as past and present environmental changes on different scales, both natural and anthropogenic. The current research areas are described on the departmental websites

www.nateko.lu.se and www.geologi.lu.se.

Specialisation in Physical Geography and Ecosystem Science

The research in Physical Geography and Ecosystem Science comprises studies of landscapes and ecosystems, including their resources and changes as a result of natural processes and human impact. Climatology, the study of climate change, is a significant component together with the processes that affect the exchange of mass and energy between ecosystems and the atmosphere. Ecosystem Science deals with vegetation dynamics, ecosystem processes and biogeochemistry among other subjects. The research is strongly focused on studies across subject boundaries of environmental and climate change, from both local and global perspectives, as well as exogenous processes applied to geomorphological landscape changes in varying climate environments. Significant components of the specialisation include the application and development of methods based on remote sensing for Earth observation as well as analysis of geographical information.

3. Objectives

Third-cycle courses and study programmes shall be based fundamentally on the knowledge acquired by students in first and second-cycle courses and study programmes, or its

equivalent. In addition to the requirements for first and second-cycle courses and study programmes, third-cycle courses and study programmes shall develop the knowledge and skills required to be able to undertake autonomous research.

A central aim of the third-cycle programme is to pursue activities of the highest international standard capable of enhancing scientific expertise and contributing to an understanding of key social and research problems involving Geobiosphere Science. Furthermore, the programme aims to provide students with:

- General knowledge of the composition and dynamics of the Earth, the evolution of organisms, the processes and ecosystems of the Earth's surface, as well as past and present environmental changes on different scales, both natural and anthropogenic
- Advanced professional and specialist expertise in one of the specialisations demonstrated through an extensive independent project in the form of a Licentiate or PhD thesis
- Familiarity and contact with the international research front and the debate in their own specialist research area through courses, literature reviews, conference participation and individual research.

The general outcomes for third-cycle courses and study programmes are defined in the Higher Education Ordinance Annex 2, the Qualifications Ordinance.

3.1 Outcomes for a Degree of Doctor

Knowledge and understanding

For the Degree of Doctor the third-cycle student shall

- demonstrate broad knowledge and systematic understanding of the research field as well as advanced and up-to-date specialised knowledge in a limited area of this field, and
- demonstrate familiarity with research methodology in general and the methods of the specific field of research in particular.

Competence and skills

For the Degree of Doctor the third-cycle student shall

- demonstrate the capacity for scholarly analysis and synthesis as well as the ability to review and assess new and complex phenomena, issues and situations autonomously and critically
- demonstrate the ability to identify and formulate issues with scholarly precision critically, autonomously and creatively, and to plan and use appropriate methods to undertake research and other qualified tasks within predetermined time frames and to review and evaluate such work
- demonstrate through a thesis the ability to make a significant contribution to the formation of knowledge through their own research
- demonstrate the ability in both national and international contexts to present and discuss research and research findings authoritatively in speech and writing and in dialogue with the academic community and society in general
- demonstrate the ability to identify the need for further knowledge, and
- demonstrate the capacity to contribute to social development and support the learning of others both through research and education and in some other qualified professional capacity.

Judgement and approach

For the Degree of Doctor the third-cycle student shall

- demonstrate intellectual autonomy and disciplinary rectitude as well as the ability to make assessments of research ethics, and
- demonstrate specialised insight into the possibilities and limitations of research, its role in society and the responsibility of the individual for how it is used.

Subject-specific outcomes for a degree of Doctor in Geobiosphere Science

On completion of the programme, the third-cycle student shall demonstrate the knowledge and skills to

- In general terms, describe changes and explain connections in one or more of the Earth's dynamic systems from both long-term and short-term perspectives and thereby demonstrate an understanding of the dynamics of the natural processes of the Earth
- Demonstrate specialised knowledge in the subject areas relevant to the student's specialisation
- Independently analyse, critically assess and draw relevant conclusions about complex geobiosphere connections based on empirical data and/or models.

3.2. Outcomes for a Degree of Licentiate

Knowledge and understanding

For a Degree of Licentiate the third-cycle student shall

- demonstrate knowledge and understanding in the field of research including current specialist knowledge in a limited area of this field, and specialised knowledge of research methodology in general and the methods of the specific field of research in particular.

Competence and skills

For a Degree of Licentiate the third-cycle student shall

- demonstrate the ability to identify and formulate issues with scholarly precision critically, autonomously and creatively, and to plan and use appropriate methods to undertake a limited piece of research and other qualified tasks within predetermined time frames in order to contribute to the formation of knowledge as well as to evaluate this work
- demonstrate the ability in both national and international contexts to present and discuss research and research findings in speech and writing and in dialogue with the academic community and society in general, and
- demonstrate the skills required to participate autonomously in research and development work and to work autonomously in some other qualified capacity.

Judgement and approach

For a Degree of Licentiate the third-cycle student shall

- demonstrate the ability to make assessments of ethical aspects of their own research
- demonstrate insight into the possibilities and limitations of research, its role in society and the responsibility of the individual for how it is used, and
- demonstrate the ability to identify the personal need for further knowledge and take responsibility for their ongoing learning.

Subject-specific outcomes for a Degree of Licentiate in Geobiosphere Science

On completion of the programme, the third-cycle student shall demonstrate the knowledge and skills to

- In general terms, describe changes and explain connections in one or more of the Earth's dynamic systems from both long-term and short-term perspectives and thereby demonstrate an understanding of the dynamics of the natural processes of the Earth
- Demonstrate specialised knowledge in the subject areas relevant to the student's specialisation.

4. Admission requirements

The requirements for admission to third-cycle courses and study programmes are that the applicant meets the general and specific entry requirements and is considered in other respects to have the ability required to benefit from the course or study programme.

General admission requirements

A person meets the general entry requirements for third-cycle courses and study programmes if they:

1. have been awarded a second-cycle qualification, or
2. have satisfied the requirements for courses comprising at least 240 credits of which at least 60 credits were awarded in the second cycle, or
3. have acquired substantially equivalent knowledge in some other way in Sweden or abroad.

The head of department may permit an exemption from the general entry requirements for an individual applicant, if there are special grounds.

Specific admission requirements

To be admitted to the third-cycle programme in Geobiosphere Science the student must have a second-cycle degree of at least 60 credits or equivalent with physical geography and ecosystem science or geology as the main subject (Master's degree or equivalent), including a degree project or equivalent of at least 30 credits. However, some research tasks may require specific basic knowledge, in which case physical geography or geology do not need to be the main subject. Instead, a subject more relevant to the research task may be accepted as a qualifying main subject, such as biogeophysics, geophysics, biogeochemistry, geochemistry, ecosystems analysis, ecology, biology, geography, geographical information science or other subjects. The specific entry requirements can also be fulfilled through an equivalent programme. This is assessed on a case-by-case basis. To be admitted to the programme, the student must also demonstrate oral and written proficiency in English.

5. Selection

In selecting between applicants who meet the requirements, their ability to benefit from the study programme shall be taken into account. However, the fact that an applicant is considered able to transfer credits from prior courses and study programmes or for professional or vocational experience may not alone give the applicant priority over other applicants.

The following selection criteria will be applied:

Results achieved in first and second-cycle courses or the equivalent. The breadth, depth and relevance of first and second-cycle courses or the equivalent. The quality of the degree project and other autonomous work.

Other knowledge or skills of relevance to the selected research specialisation.

Suitable candidates should be called to an interview, if possible.

The recruitment and selection for third-cycle studies must always take diversity and gender balance into account, in compliance with Lund University's policy for gender equality, equal opportunities and diversity. The underrepresented gender shall be given precedence in cases of equal qualifications, unless there are valid reasons to the contrary.

Furthermore, it must be possible for the department to offer expert supervision in the student's research specialisation.

6. Degree requirements

The third-cycle study programme concludes with a Degree of Doctor of Philosophy or, if the third-cycle student so wishes or if this is stated in the admission decision, a Degree of Licentiate. The student may also but is not obliged to complete a Degree of Licentiate as a stage in the third-cycle programme leading to a Degree of Doctor.

The Degree of Doctor comprises 240 credits and the Degree of Licentiate 120 credits.

For a Degree of Doctor or Licentiate, the research student must have successfully completed a PhD or Licentiate thesis and passed all courses and other components specified below.

6.1. Thesis

The programme is to include a research project documented in a PhD or Licentiate thesis. The thesis is to be defended at a public defence (Degree of Doctor) or a public seminar (Degree of Licentiate), which both have a reviewer.

PhD thesis

The PhD thesis is to comprise 180 credits.

The PhD thesis is to be a thought-out and reasoned discussion of the doctoral student's own work in relation to the broader research area and can be produced either as a *compilation thesis* or a *monograph*.

A compilation thesis consists of copies of a number of research articles or manuscripts and a summarising chapter. The research articles must be of a quality required for publication in

recognised peer-reviewed journals and it must be possible in the thesis to determine the doctoral student's contribution to the articles.

In a compilation thesis it is rarely the case that research papers are solely authored by the doctoral student. Emphasis must therefore be placed on the summarising chapter, which on the one hand provides the doctoral student with the opportunity to demonstrate autonomous and independent intellectual performance, and on the other hand enables the assessment of the doctoral student's autonomous and independent contributions. The summarising chapter must provide an introduction to the papers and situate research issues and findings in a broader context. It must therefore be written in a different form to the papers included in the thesis in order to be read as an independent scholarly text. The summarising chapter must not contain extensive duplication of text, figures and tables from the papers.

A monograph thesis is a unified report including descriptions of the research tasks, research issues, methods, analysis, findings and discussion. In particular, the monograph thesis is to present the student's own research in such a way that that the methods applied, findings obtained and conclusions drawn can be understood and assessed.

The thesis must relate to the outcomes defined in the Higher Education Ordinance, which means that the aim of the compilation thesis and the monograph is mainly to:

- demonstrate current specialist knowledge as well as a broad and deep understanding of the research field
- demonstrate the ability to situate the thesis within a broader theoretical and research context
- clearly state the aim of the thesis including its main hypotheses and research issues
- demonstrate familiarity with the methods and analytical tools used in the field of research as well as the ability to assess and evaluate them
- demonstrate the ability to reflect on the significance and limitations of their own research

- significantly contribute to the formation of knowledge in the field and identify the need for further knowledge.

The thesis must contain a popular science summary, which can be written in Swedish or English.

Licentiate thesis

The Licentiate thesis must comprise at least 75 credits.

The Licentiate thesis can either be written as a summary of at least one research article (or manuscript), which the doctoral student has authored alone or in cooperation with others, or as a unified research report (monograph). The thesis must be of a quality required for publication in recognised peer-reviewed journals and it must be possible to determine the contributions of different authors. For more information on summary and monograph theses, see the compilation thesis and monograph thesis sections above.

6.2. Courses and other programme components

The courses and other components of the third-cycle programme in Geobiosphere Science are to comprise 60 credits for a Degree of Doctor and 30–45 credits for a Degree of Licentiate.

The programme's courses and other components can be taken at Lund University or at other higher education institutions.

Compulsory courses and other components

- Introduction to Research Studies, at least 1 credit
- Faculty-wide introductory course for doctoral students, 0.5 credits
- Problem Analysis, 8 credits for a Degree of Doctor and 4 credits for a Degree of Licentiate
- Midway seminar, 1.5 credits – not compulsory for a Degree of Licentiate
- Research Ethics, 3 credits
- General Physical Geography, 4.5 credits

Training in teaching and learning in higher education corresponding to 3 credits is compulsory for doctoral students who teach.

In addition to earning credits from these compulsory components, third-cycle students are required to present their research at regular departmental seminars or other events specifically arranged for third-cycle studies.

Optional courses and other components considered relevant by the departmental representative

- Courses
- Individual commitments
- Active participation in conferences in which the third-cycle student presents their work in the form of a poster or presentation, 1.5 credits per conference (maximum 6 credits)
- Excursions with relevant scientific programme content (maximum 10 credits)
